

BITRACK - For Immediate Release

SEABROOK, NH – Martin International Enclosures (MIE) introduces the **BitRack**, the first IT rack enclosure line designed & optimized for Bitcoin Mining

The **BitRack** line of IT enclosures is the first rack line of its kind optimized for Bitcoin mining rigs and cryptocurrency mining operations. Standing 42U tall the enclosures are designed to help manage the power and heat loads of Bitcoin mining rigs. **BitRacks** are available now in three versions, from a simple open rack to a completely sealed and cooled enclosure.

BitRacks include Power Distribution Units (PDUs/power strips) to operate up to four (4) Bitcoin mining rigs. These PDUs can handle up to 4400 watts each for a **BitRack** total of 8800 watts nominal.

The **BitRack1** is a rack that can house up to (4) CoinTerra™ TerraMiner™ IV mining rigs and comes ready for your mining rigs to be installed in just minutes after you receive it. BitRack1 comes with power distribution and cords for each power supply on your mining rigs.

The **BitRack 2** has the same Power Distribution features as **BitRack 1** and is designed for a highly secure application.

The **BitRack 3** has the same mining rig Power Distribution as **BitRack 1** and **BitRack 2** but this enclosure is sealed up tight and has cooling capabilities of up to 31kw of heat enough to cool (4) CoinTerra™ TerraMiner™ IV mining rigs and has the security features of **BitRack 2**. The Air conditioning units come with duct kits to be able to attach customer supplied ducting to and direct the hot air out of the space.

Mike Martin explains MIE has a 15 year history of being an innovator in the IT space. ‘As we learned more about Bitcoin mining and the Bitcoin mining rigs, we quickly realized that the power densities were off the charts.’ A single Bitcoin mining rig produces as much heat as a full cabinet did 5-10 years ago. Martin goes on to say ‘Designing an IT cabinet line that is optimized for Bitcoin mining rigs and the facilities they are deployed in solves a problem for the rig manufacturer and the facility while delivering maximum flexibility to support basic, to highly secure, to fully climate controlled rack options.’
